

Autocam Multicontroller II

Compact Control System

The **Multicontroller II** can control up to six pan and tilt heads from the Autocam range, storing up to 100 head and lens positions for each camera at any one time, a total of 600 in all pre shot sets.

This economical and compact controller recalls shots and repositions to a selected camera location in a smooth and coordinated movement with all axes arriving at the same time. Shot transition speed is determined by the operator.

A three-function proportional rate joystick gives smooth manual positioning of the head. Pan and tilt rates are contoured with the level of joystick movement determining the speed of camera motion. Rotation of the joystick controls the zoom, while a separate rotary knob controls the focus.

Key Features and Benefits

- + **Reliable and flexible control for multi camera applications**
- + **Straightforward operation allows instinctive control**
- + **Operational performance at an affordable price**

Part Number AM-MULTICNTR-II
